What about strokes?

Around 800,000 Americans have a stroke every year. In 2022, 165,393 died. Those who survive often experience long term effects.

The standard treatment is a clot-buster called tPA that can only be used for ischemic strokes (not bleeds) and must be given within three hours.

And even then, it can fail. And if used in a stroke caused by a rupture, it can be disastrous.

tPA is given to less than 10% of stroke patients and should only be used after the type of stroke is confirmed—which takes time.

Even when given on time, it only helps 13% significantly. And it can cause significant problems—like brain bleeds.

That doesn't sound too promising. Even ICU doctors are hesitant to use it.
